

In the claims: The claims are as follows.

1. (Currently amended) A system ~~for creating and managing a site accessible as a wireless access protocol portal by terminals of different types and including a plurality of pages, characterized by, comprising:~~

a site structure database ~~(11)~~, containing data indicating how accessible content is organized at ~~the a site accessible as a wireless access protocol portal by terminals of different types, wherein the data in terms of the includes pages and information indicating their interrelationships between pages of accessible content, and includes also information indicating for each page and for each of the different terminal type types a template according to which content for the page is to be provided; and~~

a site management application, ~~(12)~~ for maintaining the site structure database (11) by providing updates to the information indicating relationships between the pages and/or the information indicating for each page and for each terminal type a template according to which content for the page is to be provided, in response to corresponding input signals.

2. (Currently amended) A system as in claim 1, ~~also for providing access to the wireless access protocol portal and further characterized by further comprising:~~

a templates data store ~~(14)~~ including templates according to which content for the pages is to be provided for different terminal types;

a content data store ~~(16)~~ including content for the pages, ~~possibly differing for the different terminal types; and~~

a content delivery application ~~(15)~~, responsive to a request for a page from a terminal of one or another of the terminal types, for creating the requested page at runtime based on a

terminal type included in the request, using information retrieved from the site structure database—(11), information retrieved from the templates data store—(14), and information retrieved from the content data store—(16), all of the information indexed by information included in the request and indicating the page and the terminal type.

3. (Currently amended) A method ~~for creating and managing a site accessible as a wireless access protocol portal by terminals of different types and including a plurality of pages, characterized by, comprising:~~

creating a site structure database, containing data indicating how accessible content is organized at a site accessible as a wireless access protocol portal by terminals of different types, wherein the data includes information indicating relationships between pages of accessible content and includes information indicating for each page and for each of the different terminal types a template according to which content for the page is to be provided; and

maintaining the site structure database by providing updates to the information indicating relationships between the pages and/or the information indicating for each page and for each terminal type a template according to which content for the page is to be provided, in response to corresponding input signals—~~a step in which a site structure database (11) is provided containing data indicating how accessible content is organized at the site in terms of the pages and their interrelationships, and also indicating for each page and each terminal type a template according to which content for the page is to be provided; and~~  
~~—a step in which a site management application (12) maintains the site structure database (11).~~

4. (Currently amended) A method as in claim 3, ~~also for providing~~

~~access to the wireless access protocol portal and further~~  
~~characterized by~~further comprising:

~~a step in which~~creating a templates data store ~~(14)~~ is  
~~provided~~ including templates according to which content for the  
 pages is to be provided for different terminal types;

~~a step in which~~creating a content data store ~~(16)~~ is ~~provided~~  
 including content for the pages, ~~possibly differing~~ for the  
 different terminal types; and

~~a step in which~~delivering content-delivery application  
 (15), in response to a request for a page from a terminal of one  
 or another of the terminal types, by creating ~~creates~~ the  
 requested page at runtime based on a terminal type included in the  
 request, using information retrieved from the site structure  
 database ~~(11)~~, information retrieved from the templates data store  
 (14), and information retrieved from the content data store ~~(16)~~,  
 all of the information indexed by information included in the  
 request and indicating the page and the terminal type.

5. (Currently amended) A computer program product comprising: a  
 computer readable storage structure embodying computer program  
 code thereon for execution by one or more computer processors,  
~~with wherein~~ said computer program code ~~characterized in that it~~  
 includes instructions for performing ~~the steps of~~ the method of  
 claim 3.

6. (Currently amended) A computer program product comprising: a  
 computer readable storage structure embodying computer program  
 code thereon for execution by one or more computer processors,  
~~with wherein~~ said computer program code ~~characterized in that it~~  
 includes instructions for performing ~~the steps of~~ the method of  
 claim 4.

7. (New) A system, comprising:

a site structure database, containing data indicating how accessible content is organized at a site accessible as a wireless access protocol portal by terminals of different types, wherein the data includes information indicating relationships between pages of accessible content and includes information indicating for each page and for each of the different terminal types a template according to which content for the page is to be provided; and

means for maintaining the site structure database by providing updates to the information indicating relationships between the pages and/or the information indicating for each page and for each terminal type a template according to which content for the page is to be provided, in response to corresponding input signals.

8. (New) A system as in claim 7, further comprising:

a templates data store including templates according to which content for the pages is to be provided for different terminal types;

a content data store including content for the pages for the different terminal types; and

means, responsive to a request for a page from a terminal of one or another of the terminal types, for creating the requested page at runtime based on a terminal type included in the request, using information retrieved from the site structure database, information retrieved from the templates data store, and information retrieved from the content data store, all of the information indexed by information included in the request and indicating the page and the terminal type.
